

TeleMobile Electronics Ltd.

2008-06-03

TeleMobile Electronics Ltd. is an innovative high-tech Polish company, main focus of which is finding and developing pioneer solutions in the area of wireless communications and electronics. Our groundbreaking project is TME LAB system, developed solely by TeleMobile engineers thanks to their knowledge and creativity.

We are the first who independently from original manufacturers (OEMs) are able to develop such a technological solution in order to provide comprehensive and multivendoring DIAGNOSTIC, TEST & REPAIR services for Base Station Subsystems (BSS) of different manufacturers (NOKIA, Ericsson, SIEMENS) and different technologies (GSM/EDGE/UMTS). Our achievement is a unique phenomenon on a global scale. TeleMobile is strongly focused on the R&D activity. Still another innovation is the Intelligent Automatic Filter Tuning Tool product (ongoing patent procedure) from TrimSolution.com(TM) family which together with TrimWare(TM) and TrimBooster(TM) softwares are perfect tools for multi-cavity filters tuning process automatisation. This innovation will be demonstrated during this year's International Microwave Symposium in Atlanta. This device can be applied widely, in GSM/EDGE/UMTS/HSDPA Base Station technologies, in order to tune precisely control screws in multi-cavity resonance filters. Thanks to TrimSolution.com(TM) products, the producers of diplexers and filters are given the chance to save a significant amount of time and money, as this device is capable to configure adequate frequency characteristics automatically, up to several times faster and more accurately than manual work. Such precision is possible due to advanced algorithms of artificial intelligence.
